

IN THE SPECIFICATION:

Please amend the Specification at paragraph [0057], as follows:

[0057] Now with reference to Figs. 5 and 6, to further ensure that the proximal catheter end regions 112, 132 [[134]] remain secured in the subcutaneous area 16 of the body 14, the hub 150 is secured to the assembly 100 by placing the catheters 110, 130 into the bottom hub portion 162 such that the first transition portion 186 is disposed in the first proximal channel 158 and the second transition portion 188 is disposed in the second proximal channel 159, with a portion of the first and second catheters 110, 130 distal of the first and second transition portions 186, 188 ~~158, 159~~ being disposed within the distal channel 155. The top hub portion 160 is pivoted about the hinge 151 to the closed position such that the tabs 172 on the top hub 160 portion snap into the recesses 174 in the bottom hub portion 162, securing the hub 150 to the catheters 110, 130. The hub 150 may now be sutured to the patient's skin by suturing the sutures (not shown) over the suture wing assemblies 157. Insertion of the catheter assembly 100 is now complete, as shown in Fig. 12, with separate but adjacent portions of the first and second proximal end regions extending distally from a common exit of the hub member, and separate and spaced apart portions thereof extending proximally through respective exits from the hub member, to connections with respective extension tubes.
